

## HIGH YIELD MARKET

### INVESTMENT COMMENTARY & REVIEW

by Bob Sydow, Kevin Buckle and Jim Lisko

Second Quarter 2016

We find it difficult to rationalize the contradictory signs given off by both risky and ostensibly risk-free assets in recent times. In this quarter, Treasuries have rallied to record lows (but still looking very cheap to the rest of the developed world), equities have leapt to new all-time highs (despite continued central bank easing), while the economies of the developed world barely manage to stay in positive territory. Something seems counterintuitive in all of this, but what is it? From a fixed income standpoint (and apparently equities as well), there is one graph (below) that really puts things into perspective. There are simply few places to go for returns.

It seems that just when the pundits believe the Federal Reserve (Fed) is finally going to follow through on rate increases, something conveniently comes up to render the Fed's innuendos un-actionable. It was a slowing China late last year, and now it's the "British exit" (Brexit). The fall-out from Brexit could take years, so now the Fed has a long-term excuse to keep rates low, along with the rest of the world's central banks. As such, worldwide monetary policies continue to "push on a string". This scenario has given high yield investors a reason to no longer fear rates, and that in turn has made high yield an oasis in the desert.

Second quarter 2016 was a banner quarter for high yield, returning +5.52%, as measured by the Barclays High Yield Index, surpassing even the strong high yield start in Q1 (+3.35%). As we shall detail below, much of this return was driven by a small segment of the high yield

universe. Q2's solid high yield returns were nonetheless somewhat confounding on the back of one of the more significant (and surprising) geopolitical events occurring during the quarter - the British vote to leave the European Union (EU). The investment community was certainly not prepared for the "leave" vote winning. However, following an immediate \$2-3 average decline in high yield bond prices, it took only a matter of days for the market to fully recover. That was it, a fleeting "whoa!" moment. To be sure, there are no immediate consequences of the U.K. exit on the financial markets (at least that we know of yet.) The vote does, however, reflect the popular uneasiness not only in Britain, but across the world, and this is not something to ignore.

At the end of 2013 when high yield was trading at a dollar price of \$103.5 (spread of 428 basis points (bps)) and the Fed was signaling an imminent easing of monetary accommodation, we believed double digit returns in high yield market were behind us, at least until we saw the next recession. Well, 2016 may prove us wrong on this thesis, as YTD returns are already approaching double digits (+9.06%), and this despite Brexit shocking most of the world in June. Sure we were bouncing off negative high yield returns in 2015, but this was principally due to severe depression conditions in the commodity sectors. Risk aversion did eventually spread to anything with a Caa handle later in that year, and this risk class (despite a strong YTD rally) continues to trade relatively wide here even in Q2 2016.

In Q2 2016, the high yield markets rallied through Brexit on the back of both decidedly increased optimism in the energy and commodity sectors, and a continuing rebound in the otherwise "left for dead" Caa credit universe. Overall, high yield spreads compressed 71bps (from 699bps to 628bps) and the yield to worst declined sharply from 8.2% to 7.3%. The +5.52% return for high yield handily surpassed all other fixed income class returns in the quarter. The 5-yr and 10-yr Treasuries also provided a strong tailwind for high yield, with yields

declining 21 and 30 bps, respectively (almost all of which occurred post-Brexit in June). As mentioned above, the big industry performance outliers (comprising 19.5% of the index combined) in the quarter were energy (+18.34%) and metals/mining (+15.22%) bonds. These two high yield sectors alone accounted for nearly 60% of the high yield market return and almost all of the spread tightening in the quarter. High yield energy credit prices, which bottomed around 60 cents (c) on the dollar at the end of January 2016, have now rallied back to 87c (not adjusting for the index exit of bankrupt energy names and entrance of fallen angels over the period). Interestingly, excluding the outsized returns of these two sectors, the balance of the market just performed roughly in line with U.S. Treasuries during the quarter. As noted above, the other big contributor in the quarter was the performance of Caa credits (acknowledging this includes some energy and commodity issuers). Caa-rated bonds returned +11.83% in the quarter, as spreads compressed by 213bps (from 1,398bps to 1,185bps). This class of credits now trade approximately 581bps wide of single B's. To put this in perspective, at the end of February 2016, Caa-rated bonds were approaching near recessionary spread differentials versus B's, at approximately 866bps, while peaking (at its tightest) around 225bps in December 2013. It is therefore not surprising to have seen a rebound in this risk class, which we expect may continue albeit at a more modest clip in coming months.

Default activity (including distressed exchanges)

continues to be dominated by the energy and mining sectors. In fact, almost 85% of defaults YTD are from these industries. The reported 12-month trailing U.S. high yield default rate (including distressed exchanges) fell to 4.68% (source: J.P. Morgan) in the quarter. Notably, excluding energy and commodities, the high yield default rate is a miniscule .53%. Although energy and commodity names will still continue to dominate near term defaults, we expect to see an uptick in other industries (especially if Caa access to the markets remains limited as it is currently). Virtually absent Caa issuance in the quarter (and YTD,) U.S. new issuance was still fairly solid in Q2 with approximately \$82 billion pricing. This is still down about 20% quarter over quarter and YTD, new issuance trails the previous year by 35%.

Technicals continue to be the dominant theme in all markets, and high yield is no exception here. We expect the backdrop of continuing absolute low rates, limited high yield new issuance, and the modestly growing U.S. economy to continue to support U.S. high yield markets. We acknowledge the unsustainable pace of the high yield rally YTD but believe there is still selective value to be found in the lower quality tier asset class. So until the next significant geopolitical event (and maybe not even then), we maintain a relatively sanguine outlook for our market in the near term.

High Yield Portfolio Managers at Pacific Income Advisers.

Pacific Income Advisers, Inc. (PIA) is an autonomous investment management firm registered under the Investment Advisers Act of 1940. PIA manages a variety of fixed income, equity, and balanced assets for primarily United States clients. The information contained herein is based on internal research derived from various sources and does not purport to be statements of all material facts relating to the securities mentioned. Fund holdings and/or sector allocations are subject to change at any time and are not recommendations to buy or sell any security.

**The fund's investment objectives, risks, charges and expenses must be considered carefully before investing. The statutory and summary prospectus contains this and other important information about the investment company, and it may be obtained by calling 800-251-1970 or visiting [www.PIAMutualFunds.com](http://www.PIAMutualFunds.com). Read it carefully before investing.**

*Mutual fund investing involves risk. Principal loss is possible. Investments in debt securities typically decrease in value when interest rates rise. This risk is usually greater for longer-term debt securities. The Fund may invest in foreign securities which involve greater volatility and political, economic and currency risks and differences in accounting methods. These risks may increase for emerging markets. Investment by the Fund in lower-rated and non-rated securities presents a greater risk of loss to principal and interest than higher-rated securities. The Fund may invest in derivatives, which may involve risks greater than the risks presented by more traditional investments. The risk of owning an exchange-traded fund ("ETF") or mutual fund generally reflects the risks of owning the underlying securities that the ETF or mutual fund holds. It will also bear additional expenses, including operating expenses, brokerage costs and the potential duplication of management fees. These risks are fully disclosed in the Prospectus.*

Index performance is not indicative of Fund performance. It is not possible to invest directly in an index. For current standardized performance of the Fund, please visit [www.piamutualfunds.com](http://www.piamutualfunds.com) or call 310-393-1424.

Barclays High Yield Index - covers the universe of fixed rate, non-investment grade debt. Eurobonds and debt issues from countries designated as emerging markets (e.g., Argentina, Brazil, Venezuela, etc.) are excluded, but Canadian and global bonds (SEC registered) of issuers in non-EMG countries are included. Original issue zeroes, step-up coupon structures, 144-As and pay-in-kind bonds (PIKs, as of October 1, 2009) are also included. The index includes both corporate and non-corporate sectors. The corporate sectors are Industrial, Utility, and Finance, which include both U.S. and non-U.S. corporations. The Yankee sector has been discontinued as of 7/1/00. The bonds in the former Yankee sector have not been removed from the index, but have been reclassified into other sectors.

Federal Reserve - The central bank of the United States and the most powerful financial institution in the world. It was founded by the U.S. Congress in 1913 to provide the nation with a safe, flexible and stable monetary and financial system.

Brexit - an abbreviation of "British exit", which refers to the June 23, 2016 referendum by British voters to exit the European Union.

Monetary policy consists of the actions of a central bank, currency board or other regulatory committee that determine the size and rate of growth of the money supply, which in turn affects interest rates.

European Union (EU) is a group of 28 countries that operates as a cohesive economic and political block.

Basis point (bp) - A unit that is equal to 1/100th of 1%, and is used to denote the change in a financial instrument.

Spread - The difference between yields on differing debt instruments, calculated by deducting the yield of one instrument from another.

Yield to worst (YTW) is the lowest potential yield that can be received on a bond without the issuer actually defaulting.

The Barclays' Quality sectors discussed above use the following rating methodology. Securities that are rated by three rating agencies, (Moody's, S&P and Fitch) will receive the middle of the three ratings. Securities that are rated by only two agencies will receive the lower of the two ratings. Securities rated by only one agency will receive that rating while securities not covered by any of the three agencies will receive a non-rated (NR) rating. Long-term credit ratings are denoted with a letter: a triple A (AAA) is the highest credit quality, and C or D (depending on the agency issuing the rating) is the lowest or junk quality.

New Issue (issuance) - A reference to a security that has been registered, issued and is being sold on a market to the public for the first time.

Default - The failure to promptly pay interest or principal when due.

Default Rate - The rate of borrowers who fail to remain current on their loans. It is a critical piece of information used by lenders to determine their risk exposure and economists to evaluate the health of the overall economy.

Opinions expressed are subject to change, are not intended to be a forecast of future events, a guarantee of future results, nor investment advice.
